

# TABLE OF CONTENTS

**PREFACE**    **xiii**

**ACKNOWLEDGMENTS**    **xvii**

**ABOUT THE AUTHOR**    **xix**

## **CHAPTER 1**

### **CONCEPTS IN AQUATIC CHEMISTRY**    **1**

- 1.1 Introduction    1
- 1.2 The Structure of Water Molecules and Interactions among Them    5
- 1.3 The Behavior of Solutes in Water; Dissolution of Salts    6
- 1.4 Common Ways of Expressing Concentrations in Environmental Chemistry    9
  - 1.4.1 Mass/Volume and Mass/Mass Units for Solute Concentrations    9
  - 1.4.2 Gas-Phase Concentrations    11
  - 1.4.3 Composite Parameters, Concentrations Reported “as X,” and Other Unusual Representations of Solute Concentration    12
- 1.5 Characterizing Chemical Reactivity    19
  - 1.5.1 Factors Affecting the Reactivity of Chemicals    19
  - 1.5.2 Defining Chemical Reactivity (Activity) and the Standard State    21
  - 1.5.3 Predicting Activity Coefficients from Knowledge of the Solution Composition    28
  - 1.5.4 The Activity as an Intensive Property and a Mean Field Parameter    34
- 1.6 Chemical Reactions and Chemical Equilibrium    35
  - 1.6.1 How and Why Chemical Reactions Occur: A Molecular-Level Picture of an Elementary Reaction and the Factors that Affect Its Rate    35
  - 1.6.2 Models of Chemical Equilibrium    38

1.6.3 The Kinetic Model for Chemical Equilibrium and the Definition of the Equilibrium Constant    40

1.6.4 Effect of Temperature on Reaction Rate Constants and the Equilibrium Constant    46

1.7 Combining Chemical Reactions    48

Summary    50

Problems    52

Appendix 1A: Models for the Kinetics of Elementary Reactions    54

The Collision Model    54

The Activated Complex Model    56

## **CHAPTER 2**

### **POTENTIALS, ENERGY, AND FORCES: WAYS TO INTERPRET CHANGES IN PHYSICAL/CHEMICAL SYSTEMS**    **60**

- 2.1 Introduction    60
- 2.2 Defining and Quantifying Entropy    62
  - 2.2.1 Entropy and the Second Law: The Thermomechanical Interpretation    62
  - 2.2.2 The Microscopic View of Entropy and the Second Law    64
- 2.3 Entropy Analysis Applied to Specific Systems: Potential Energy, Potentials, and Forces    75
  - 2.3.1 Potential Energy, Potential, and Force in Gravitational Systems    75
  - 2.3.2 Potential Energy, Potential, and Force in Electrical Systems    77
  - 2.3.3 Systems with More than One Type of Potential Energy    78
- 2.4 Potential and Potential Energy in Chemical Systems    80
  - 2.4.1 The Entropy Change Accompanying a Chemical Reaction at Constant Temperature and Pressure    81
  - 2.4.2 Definition of the Gibbs Function and Its Use as a Surrogate for Entropy Changes in Reactive Systems    82

- 2.5 Defining and Quantifying the Chemical Potential 84
- 2.5.1 Definition of the Chemical Potential 84
- 2.5.2 Quantifying Molar Gibbs Energy (Chemical Potential) and Molar Enthalpy 85
- 2.5.3 The Molar Gibbs Energy under Non-standard State Conditions 86
- 2.5.4 Using Chemical Potential to Interpret Molecular Diffusion 93
- 2.5.5 Effect of External Electric Fields on Chemical Reactivity: Electrochemical Potential and Electrochemical Activity 96
- 2.5.6 Comparison of Alternative Expressions for  $\bar{G}_i$  98
- 2.5.7 Comparison of  $\bar{G}_i$  of Different Species 100
- 2.6 Interpretation of Chemical Processes in Terms of Chemical Potentials 104
- 2.6.1 The Driving Force for Chemical Change and the Gibbs Energy of Reaction 104
- 2.6.2 The Relationship of the Gibbs Energy of Reaction to the Equilibrium Constant 107
- 2.6.3 The Gibbs Energy of Reaction Under Non-Equilibrium Conditions 110
- 2.6.4 Interpreting Changes in Gibbs Energy, Enthalpy, and Entropy in Chemical Reactions 118
- 2.6.5 The Dependence of  $\Delta G_r^\circ$  and  $K_{\text{eq}}$  on Temperature and Pressure 119
- 2.6.6 The Entropy, Enthalpy, and Gibbs Energy of Composite Reactions 122
- 2.6.7 Dissolution versus Reaction with the Solvent 125
- Summary 125
- Problems 127
- 3.4 Strong and Weak Acids,  $K_a$ , and Conjugate Acid/Base Pairs 137
- 3.5 A Brief Diversion: The Structure of Some Important Organic Acids and Bases 144
- 3.6 Combining Acidity Reactions and the Definition of Basicity 146
- 3.7 Acid/Base Speciation as a Function of pH; Diagrams of Log  $C$  versus pH 150
- 3.7.1 More Chemical Shorthand:  $\alpha$  Notation 150
- 3.7.2 Acid/Base Speciation as a Function of pH 151
- 3.7.3 Log  $C$ -pH Diagrams for Monoprotic Acids 154
- 3.7.4 Log  $C$ -pH Diagrams for Multiprotic Acids 157
- 3.8 Determining Species and Relevant Equations for Solving Equilibrium Problems 161
- 3.9 Numerical Approaches for Solving Acid/Base Problems 169
- 3.9.1 The pH of Solutions Containing Only Water and Strong Acids or Bases 170
- 3.9.2 The pH of Ideal Solutions Containing Weak Acids and Bases 172
- 3.9.3 A Simple Spreadsheet Analysis for Determining Acid/Base Speciation 177
- 3.9.4 The pH and Speciation of Systems Containing Multiprotic Weak Acids and Bases 181
- 3.9.5 Acid/Base Equilibria in Non-ideal Solutions 182
- Summary 185
- Problems 185

**CHAPTER 3****ACIDS AND BASES, PART 1 131**

- 3.1 Introduction 131
- 3.2 The Dissociation of Water;  $K_w$  134
- 3.3 The Structure of Acids and Bases 135

**CHAPTER 4****ACIDS AND BASES, PART 2 188**

- 4.1 Graphical Solutions for Sets of Simultaneous Equations 188
- 4.2 Using Log  $C$ -pH Diagrams to Solve Weak Acid/Base Problems 189
- 4.3 The Mass Balance on H (the Proton Condition or *TOTH* Equation) 203

- 4.4 Identifying Dominant Species 218
- 4.5 Putting It All Together: Use of Log  $C$ -pH Diagrams and the PC or  $TOTH$  Equation to Solve for Solution Speciation 222
- 4.6 Some Points about Non-obvious Proton Conditions 227
  - Summary 229
  - Problems 230
  - Appendix 4A: Arithmetic Operations and Log-Log Diagrams 235

## CHAPTER 5

### TITRATIONS AND BUFFERS 237

- 5.1 Introduction 237
- 5.2 Reactions Occurring during a Titration: Qualitative Considerations 238
- 5.3 Quantitative Interpretation of Titration Data 242
  - 5.3.1 Titration of a Strong Acid with a Strong Base 242
  - 5.3.2 Titration of a Weak Acid with a Strong Base 244
  - 5.3.3 Titrations of Multiprotic Acids and Bases 249
  - 5.3.4 Titration of Solutions Containing Unknown Acids and Bases 249
  - 5.3.5 Units for Quantifying Titration Data: Equivalents and mg/L as  $\text{CaCO}_3$  252
  - 5.3.6 Titrations with Weak Acids or Bases 254
  - 5.3.7 The Effect of the Acidity of Water on Titration Curves 256
- 5.4 Practical Aspects of Titrations: Equivalence Points and Alkalinity 257
  - 5.4.1 Equivalence Points 257
  - 5.4.2 Equivalence Points in the Carbonate System 260
  - 5.4.3 The Conceptual Basis and Definition of Alkalinity and Acidity 262
  - 5.4.4 Computing Alkalinity from Titration Data or Based on Solution Composition 263
  - 5.4.5 Alkalinity as a Conservative Quantity 268
- 5.4.6 pH and ALK in Carbonate-Dominated Systems 273
- 5.4.7 Alkalinity of Natural Waters 274
- 5.4.8 Summary of the Alkalinity Concept 274
- 5.5 Buffers 276
  - 5.5.1 Definition of the Buffer Intensity 276
  - 5.5.2 The Buffer Intensity of Water and Weak Acid/Base Groups 277
  - 5.5.3 The Buffer Intensity of Multiprotic Acids 282
    - Summary 286
    - Problems 288
    - Appendix 5A: Derivation of the Expression for Buffer Intensity of Multiprotic Acids 292

## CHAPTER 6

### SOFTWARE FOR SOLVING CHEMICAL EQUILIBRIUM PROBLEMS 294

- 6.1 Introduction 294
- 6.2 Defining the Composition of the System: Components and Species 296
- 6.3 Completing the Input Matrix: Estimating *Component* Concentrations and Computing *Species* Concentrations 301
- 6.4 Evaluating Mass Balances on the *Components* 302
- 6.5 Incorporating Ion Activity Coefficients in the Calculations 308
- 6.6 Determining the Equilibrium Speciation of a System Under Several Similar Conditions: Simulating Titrations with Chemical Equilibrium Software 309
- 6.7 Systems in Which the Equilibrium Activities of One or More *Species* Are Known 312
- 6.8 Using Chemical Equilibrium Software to Develop Log  $C$ -pH Diagrams 317
  - Summary 318
  - Problem 319
  - Appendix 6A: Terminology Used in Conjunction with Chemical Equilibrium Software 320

**CHAPTER 7****GAS/LIQUID EQUILIBRIUM 322**

- 7.1 Overview 322
- 7.2 Basic Concepts and Terminology for Gas Transfer Reactions 323
  - 7.2.1 Gas-Phase Concentrations and the Ideal Gas Law 323
  - 7.2.2 The Chemical Activity of Gas-Phase Constituents 324
  - 7.2.3 Quantifying Gas/Liquid Equilibrium: Henry's Law 326
  - 7.2.4 Physical and Chemical Factors Affecting the Henry Law Constant 332
  - 7.2.5 Henry's Law and Aqueous-Phase Speciation 335
  - 7.2.6 Effect of Gas/Liquid Equilibration on Gas-Phase Composition 335
- 7.3 Effect of Ionization of Dissolved Gases on Gas/Liquid Equilibrium 337
  - 7.3.1 The pH of Solutions in Equilibrium with Acidic or Basic Gases 340
  - 7.3.2 The Proton Condition or *TOTH* Equation for a Solution in Equilibrium with a Gas 346
  - 7.3.3 Buffering in Solutions Equilibrated with Weak Acid and Weak Base Gases 347
- 7.4 CO<sub>2</sub> Dissolution, Alkalinity, and Acidity 350
- 7.5 Including Gas/Liquid Equilibrium in Computer Equilibrium Programs 352
  - Summary 356
  - Problems 357

**CHAPTER 8****CHEMISTRY OF METALS IN AQUEOUS SYSTEMS 362**

- 8.1 Introduction 363
- 8.2 Speciation of Dissolved Metals 363
  - 8.2.1 Complexation with H<sub>2</sub>O or OH<sup>-</sup> 363
  - 8.2.2 Log *C*-pH Diagrams for Dissolved Metals 369
  - 8.2.3 Complexes with Other Ligands 370
  - 8.2.4 Mixed Ligand Complexes and Chelating Agents 371

- 8.2.5 Metal Speciation in Systems Containing Complexing Ligands 372
- 8.3 Use of Chemical Equilibrium Software to Model Systems Containing Metals, Ligands, and Complexes 381
- 8.4 Metal Ion Buffers 383
- 8.5 Predominance Area Diagrams 386
- 8.6 Summary of Soluble Me-L Chemistry 393
- 8.7 Introduction to Precipitation Reactions: Metal Oxides and Hydroxides 394
  - 8.7.1 The Chemical Activity of Solids: Definition and Explanation 396
  - 8.7.2 Definition of the Solubility Product 397
  - 8.7.3 The Log *C*-pH Diagram for a Solution in Which a Solid is Known or Presumed to be Present at Equilibrium 399
  - 8.7.4 Systems Containing Ligands Other than OH<sup>-</sup> 403
- 8.8 Precipitation of Solids Other than Hydroxides 404
  - 8.8.1 Speciation in a System with Fixed *TOTCO*<sub>3,diss</sub> 405
  - 8.8.2 Speciation in a System with Fixed *P*<sub>CO<sub>2</sub></sub> 409
- 8.9 Precipitation and Complexation with the Same Ligand 411
- 8.10 Use of Chemical Equilibrium Software to Model Systems in Which Solids Are Known to Be Present 413
- 8.11 Determining Whether a Solid Will Precipitate under Given Conditions 417
  - 8.11.1 Systems in Which Only One Solid Need Be Considered 418
  - 8.11.2 Systems in Which More than One Solid Must Be Considered 421
  - 8.11.3 The Relative Solubilities of Solid Polymorphs 430
- 8.12 Use of Chemical Equilibrium Software to Model Systems in Which Precipitation and Dissolution Are Possible, But Not Ensured 431
- 8.13 The Gibbs Phase Rule 433

- 8.14 Integrated Analysis of a Model System: Titration of a Carbonate-Containing Solution with  $\text{Zn}(\text{NO}_3)_2$  437
- 8.15 Predominance Area Diagrams Considering Possible Precipitation of Solids 447
  - Summary 451
  - Problems 453
  - Appendix 8A: An Explanation for the Constancy of the Activity of Pure Solids, Based on Mass Action Considerations 461

**CHAPTER 9****REDOX CHEMISTRY 464**

- 9.1 Introduction: Definitions of Oxidation, Reduction, Redox Reactions, and Oxidation State 464
  - 9.1.1 Determining Oxidation Numbers 468
  - 9.1.2 Balancing Redox Reactions 470
  - 9.1.3 Redox Half-Cell Reactions 472
  - 9.1.4 The Activity of Free Electrons and Equilibrium Constants for Redox Half-Cell Reactions 475
- 9.2 The Molar Gibbs Energy of Electrons 478
- 9.3 An Alternative Way of Expressing Electron Activity: The  $E_H$  Scale 479
- 9.4 Definition of  $e^\circ$  and  $pe^\circ$  480
  - 9.4.1 Computing  $pe$  from Species Activities: The Nernst Equation 487
  - 9.4.2 Using  $pe^\circ$  Values to Determine Overall Redox Equilibrium Constants 489
  - 9.4.3 Redox Reactions Involving Exchange of Both Electrons and Protons; Definition of  $pe_{\text{pH}}^\circ$  491
- 9.5 Energy Changes Accompanying Redox Reactions 496
  - 9.5.1 The Gibbs Energy Change Accompanying Redox Reactions 496
  - 9.5.2 Relating  $\Delta G$ ,  $pe$ , and  $E_H$  to Redox Equilibrium Constants and the Extent of Disequilibrium 500
- 9.6 Speciation in Redox Systems: Log  $C$ - $pe$  Diagrams 501
  - 9.6.1 Determining the Equilibrium Speciation in a Redox System with Known Inputs 504
- 9.7 Modeling Redox Speciation with Chemical Equilibrium Software 511
- 9.8 Oxidation and Reduction of Water 516
  - 9.8.1 The Log  $C$ - $pe$  Diagram for the  $\text{H}_2/\text{H}_2\text{O}/\text{O}_2$  Redox System 516
  - 9.8.2 The Impossibility of Redox Equilibrium Between  $\text{H}_2\text{O}$  and the Atmosphere 519
  - 9.8.3 Considering Redox Activity of Water When Analyzing  $pe$  of a Solution 520
- 9.9 Redox Titrations, Redox Buffering, and the Geochemical Redox Sequence 525
- 9.10  $pe$ - $\text{pH}$  Predominance Area Diagrams 529
- 9.11 Redox Reactions and Electrochemistry 533
  - 9.11.1 Anodes, Cathodes, and Pathways of Electrochemical Reactions 533
  - 9.11.2 Quantifying the Driving Force and Energy Change in Electrochemical Reactions 534
  - 9.11.3 Redox Reactions in Systems with Externally Imposed Electrical Potentials 537
  - 9.11.4 Redox Electrodes, Reference Electrodes, and the Measurement of  $E_H$  538
    - Summary 543
    - Problems 545

**CHAPTER 10****ADSORPTION REACTIONS 550**

- 10.1 Introduction 550
  - 10.1.1 Chapter Overview 550
  - 10.1.2 Terminology 553
- 10.2 Two Views of the Interface and Adsorption Equilibrium 554
  - 10.2.1 Adsorption as a Surface Complexation Reaction 554
  - 10.2.2 Adsorption as a Phase Transfer Reaction 556
  - 10.2.3 Which Model and Which Equilibrium Expression Are Best? 558
- 10.3 Quantitative Representations of Adsorption Equilibrium: The Adsorption Isotherm 558
  - 10.3.1 The Langmuir Isotherm 562

10.3.2	Adsorption in Systems with Non-uniform Surface Sites	567	10.6.2	Bidentate Surface Complexation	610
10.4	Using Chemical Equilibrium Computer Models to Solve for Speciation in Adsorptive Systems	582	10.6.3	Surface Precipitation	612
10.4.1	Modeling Single- and Multiple-Site Langmuir Adsorption	582	10.7	Sorption onto Inorganic Solids in Natural and Engineered Aquatic Systems	615
10.4.2	Using Chemical Equilibrium Software to Model the Freundlich Isotherm	584	10.7.1	Sorption of Natural Organic Matter During Coagulation of Drinking Water	615
10.5	Interactions between Charged Surfaces and Ionic Adsorbates: The Effect of Surface Potential on Adsorption of Ions	585	10.7.2	Sorption of Metals	619
10.5.1	The Origins of Surface Charge on Suspended Particles	590	10.7.3	Sorption of Metallic Oxyanions	620
10.5.2	The Distribution of Ions near a Charged Interface and the Corresponding Charge-Potential Relationship	593	10.7.4	Effects of Complexing Agents on Metal Sorption	621
10.5.3	The Effect of Electrical Potential on Distribution of Ions in a Solution	597	10.7.5	Empirical Evidence for Surface Precipitation	625
10.5.4	Putting It All Together: The Equations Describing Ionic Adsorption	603		Summary	626
10.5.5	Summary of Adsorption under Conditions Where Electrostatic Interactions Are Significant	605		Problems	627
10.5.6	Accounting for Surface-Adsorbate Electrical Interactions in Chemical Equilibrium Computer Models	606			
10.6	Adsorption Isotherms in Two Special Cases: Bidentate Adsorption and Surface Precipitation	608			
10.6.1	Introduction	608			

**APPENDIX A**  
**THERMODYNAMIC DATA AND**  
**EQUILIBRIUM CONSTANTS 633**

**APPENDIX B**  
**LIST OF IMPORTANT EQUATIONS 649**

**APPENDIX C**  
**NOMENCLATURE 654**

**INDEX 659**
