

Substitution and Laws of Exponents: Problem Type 1

• Example 1

Solve the equation for x in terms of y and z .

$$x^3 = \frac{y^3}{(3z)^3}$$

Using the properties of exponents we can write the right hand side as

$$\left(\frac{y}{3z}\right)^3$$

Thus we have

$$x^3 = \left(\frac{y}{3z}\right)^3$$

Taking the cube root on both sides, we obtain

$$x = \frac{y}{3z}.$$

● ● ● CHECK YOURSELF 1

Solve the equation for x in terms of y and z .

$$x^5 = \frac{(2z)^5}{y^5}$$

● ● ● CHECK YOURSELF ANSWER

1. $x = \frac{2z}{y}.$
